

# Integra OAP-Ascom

## Software Licenses

In Integra it is possible to integrate paging systems for sending alarms or text messages to pagers. It is also possible, with proper equipment, to send alarms from pagers, i.e. assault alarm or man down.

## Performance

Ascom Tateco is a paging and personal alarm system that Integra can receive alarms from. Paging system is integrated in Integra software. Ascom Tateco is using OAP (Open Access Protocol) which allows applications to be completely customizable by users to fit specific needs. OAP is an advanced two-way protocol which allows quick response of messages and events.

There are two possibilities how to send paging message to portable device. The first one is manual sending and second one is alarm paging. Manual sending has the lowest message priority and this can't be changed. The message priority for alarm paging can be changed in Presentation Group.

The Open Access Protocol can be used by a client application for communication with a Cordless Telephone System and System 900. The client communicates with an OAP Server. The protocol is XML based and is sent to the OAP Server over the LAN using a TCP connection. The device we are able to connect to is called UPAC.
