

Seamless integrations for every need

Check In is available in several packages, designed to meet the varying needs of all customers. From small sites that require only essential visitor management functionality to large, multi-site organizations with advanced requirements for integrations and features.

Many customers start with a single site and expand over time. With Check In's integrations and API's, the system scales seamlessly, enabling higher levels of automation and significantly reducing manual work as your needs grow.

Exchange

You can of course pre-book visitors and groups in the Check In web interface from any device. Type in the information or drag and drop an excel file.

You can also use the Exchange integration and get your visitors and meetings in Outlook transferred into Check In. This is preferable if you have a lot of visitors and groups checking in.

Each visitor get a SMS or an email sent the evening before the meeting, with details and a QR-code for a smooth and fast check in process.

Without the pre-booking, visitors check in manually on the self service kiosk.

Staff synchronization

Sync via EntralID or ADFS for organizations with lots of staff when all staff is administrated from your own Active Directory. Using the synchronization gives the benefit of having all data updated every day without any manual work at all. For smaller sites with less staff, it's very easy to administrate the staff list directly in the Check In web interface.

API to other systems

SystemHouse Solutions provide an open API for any integration. Most common is to integrate with access control.

On Prem or in Cloud

The choice is yours. Our cloud solution is securely hosted in Stockholm, ensuring that all data remains within the Nordics and meets strict regional compliance requirements. That's why nearly 90% of our customers choose our cloud platform for its simplicity, security, and scalability. If your organization requires an on-premises deployment, we offer that flexibility as well delivering the same great solution, tailored to your infrastructure and governance needs.
